I. INTRODUCTION

The Food Stamp Program (FSP) is a central component of America's anti-poverty program. The major purpose of the FSP is "to permit low-income households to obtain a more nutritious diet . . . by increasing their purchasing power" (The Food Stamp Act of 1977, as amended, P.L. 95-113). The FSP is the largest of the domestic food and nutrition assistance programs administered by the U.S. Department of Agriculture's Food and Nutrition Service (FNS). During fiscal year 1997, the FSP served an average of 22.9 million persons per month. Almost \$19.6 billion were paid out in food stamps that year.

The characteristics of food stamp households and the level of FSP participation change over time in response to economic and demographic trends, and to legislative changes in eligibility requirements. To track these changes and measure their effect on the FSP, FNS relies on data from the QC database, which is an edited version of the FSP's Integrated Quality Control System (IQCS) database. The IQCS database contains detailed demographic, economic, and FSP eligibility information for a nationally representative sample of approximately 50,000 FSP units. The IQCS data are generated from monthly quality control (QC) reviews of FSP cases that are conducted by state FSP agencies to assess the accuracy of eligibility determinations and benefit calculations for the state's FSP caseload. These data, which are produced annually, are ideal for tabulations of the characteristics of food stamp units and for simulating the impact of various reforms to the FSP on current FSP units.

This document describes the variables in the QC database and how the IQCS data are cleaned and edited to create the QC database. It also describes how the QC Minimodel--one of FNS's food stamp microsimulation models--uses the QC data to simulate the impact of various reforms to the FSP on current FSP participants. Although this document is designed to be general enough for analysts and

new users of the data, programmers will find enough detailed information to re-create the file, tabulate the file, or use the file in the QC Minimodel.

The overview of the QC database (Section 1 of this document) describes the FSP's Quality Control System, the IQCS data that are the result of that system, and how the IQCS data are transformed into the QC database. The overview, written for a nontechnical audience, is designed to give analysts and new users of the data enough general information about the data to analyze and interpret the results of tabulations and QC Minimodel reform simulations.

The creation of the QC database (Section 2) details the QC database file development process. Section II, written for a technical audience, describes each program used to transform the IQCS data into the QC database.¹ It also presents the algorithms used in the program that edits the IQCS data for consistency and describes the development of the weights for the file.

The creation of the database-specific portion of the QC Minimodel (Section 3) explains how the QC data are used by the QC Minimodel to simulate reforms to the FSP. This section documents the database-specific algorithms used by the model. It also provides a technical description of the procedures used to transform data elements from the QC database into the data elements required as input to the model.

The codebook (Section 4) describes each variable in the QC database and includes the variable name, its origin, and a description that includes all the valid values of the variable. The section also explains how to use the codebook.

Appendix A describes the automated edits to FSP units. Appendix B shows the derivation of monthly sampling weights used in the QC file. Appendix C contains the parameter values used in

¹A SAS version and two binary versions of the QC database are created. The SAS file is used for tabulations of the characteristics of FSP households. One binary file is used to tabulate the characteristics of FSP households with Table Producing Language software, and the other binary file is used as the underlying database for FNS's QC Minimodel.

determining FSP eligibility in FY 1997 for parameters such as the FSP net income screen and maximum benefit levels. Appendix D lists the state and region identification codes used in the file, and Appendix E contains the Integrated Review Schedule--the coding form on which the raw data for the IQCS file is originally recorded by the state QC System reviewers.

Key Changes from 1996 QC Database

The major changes since the previous QC database are the addition of several new variables, SSIIND1-SSIIND15, FSNUMPRA, FSNABAWD, and SEED. SSIIND1-SSIIND15 are new person level indicators for identifying SSI recipients. These variables are used in place of SSI1-SSI15 in determining FSNDIS and the person level flags DIS1-DIS15. FSNUMPRA is the number of permanent resident aliens in the food stamp unit. FSNABAWD is the number of able-bodied adults without dependents in the food stamp unit. SEED is a random number variable added to assist in reform runs of the QC minimodel. Additionally, the variable MTHWGT has been removed as the variable HWGT now represents the monthly weight². Also, the automated edits to aliens have been expanded slightly to account for non-alien deeming. Another change was to allow the earned income deduction to be equal to 20 percent of unit earned income (rounded down).

² In the 1996 QC file, the variable MTHWGT was created to accurately represent the monthly caseload amounts due to some missing monthly data. Starting in 1997, the variable HWGT has been adjusted to correctly deal with the data and thereby reflect monthly caseload amounts.

SECTION 1 OVERVIEW OF THE QC DATABASE

II. OVERVIEW OF THE QC DATABASE

The QC database is an edited version of the Food Stamp Program's Integrated Quality Control System (IQCS) database. The IQCS database contains detailed demographic, economic, and FSP eligibility information for a nationally representative sample of approximately 50,000 FSP units. These data, which are produced annually, are ideal for tabulations of the characteristics of food stamp units and for simulating the impact on current FSP units of various reforms to the FSP. This overview describes the raw IQCS file and the processing and edits that convert it to the QC database. ²

A. THE QC SYSTEM

The IQCS data are generated from monthly quality control (QC) reviews of FSP cases that are conducted by state FSP agencies. The primary objective of the QC review is to assess the accuracy of eligibility determinations and benefit calculations. That is, the review is designed to determine (1) if units are eligible for participation and receiving the correct coupon allotment, and (2) if unit participation is correctly denied or terminated. QC reviews are essentially an audit through which states are held accountable for the accuracy of FSP certification.

The Quality Control System is based on a national sample of participating units and a somewhat smaller number of denials and terminations. The national sample of participating units is stratified by month and by the 50 states, the District of Columbia, Guam, and the Virgin Islands. Annual state

¹The term "FSP unit" refers to the persons in a household who together are certified for and receive food stamps. The term "FSP household" refers to all persons who reside together in a household that contains at least one person receiving food stamps. As such, an FSP household may contain non-FSP persons and/or multiple FSP units. Any references in the text to "unit" refer only to those persons in the household's primary FSP unit (that is, the FSP unit selected for the sample). Any references to "household" refer to the FSP unit as well as any other persons in the same household as the FSP unit.

²Section II (Creation of the QC Database) provides more technical information on the QC file development process.

samples range from 300 to 2,400 reviews, depending on the size of the monthly participating caseload. Several states have integrated Food Stamp, Aid to Families with Dependent Children (AFDC), and Medicaid QC sample selection and review processes.

IQCS data are collected by state QC reviewers, who gather financial and demographic information from the sampled household's case file, visit the household and re-interview the participants, determine whether the household received the correct FSP coupon allotment, enter all review information on a data coding form, and then send the coding form to FNS's national computer center where it is entered into the IQCS database. FNS regional offices then conduct a federal re-review of a subsample of the original state sample. Federal re-review data is sent to the national computer center where it is entered into the IQCS database and used in conjunction with the state review data to calculate the official payment error rate for each state. States are sanctioned or rewarded on the basis of their official payment error rates.

Although calculating state payment error rates is the primary objective of the QC system and its resulting IQCS file, the IQCS also functions as an important source of detailed demographic and financial information on a large sample of active food stamp households in a given fiscal year. The IQCS data are the source for FNS's annual report entitled *Characteristics of Food Stamp Households* and for FNS's QC Minimodel, a microsimulation model that estimates the impact of proposed reforms to the FSP on current participants.

B. THE IQCS SAMPLE

Each month, food stamp agencies in all 50 states, the District of Columbia, Guam, and the Virgin Islands draw two samples: one of households receiving food stamps in their state (active cases), and another, smaller sample of households that were either terminated from the program or applied for the program but were denied benefits in their state. While almost all participating food stamp units are

included in the sample of active cases, certain types of units not appropriate for QC review are excluded. Specifically, the active cases universe includes all units receiving food stamps during a review period except cases in which the participants died or moved outside the state, received benefits by a disaster certification authorized by the FNS, received benefits under a 60-day continuation of certification, were under investigation for FSP fraud (including those with pending fraud hearings), were appealing a notice of adverse action and the review date falls within the period covered by continued participation pending hearing, or received restored benefits in accordance with the FNS-approved state manual but who were otherwise ineligible. The sampling unit within the active universe is the food stamp unit as defined in an FNS-approved state manual.

State sampling plans must conform to accepted principles of probability sampling. A state may use simple random sampling or any of various complex designs that best meet its needs. Sampling designs other than simple random sampling must be approved by FNS.

Annual state sample sizes range from a minimum of 300 to 2,400 reviews depending primarily on the size of the monthly participating caseload. States must use the following guidelines when determining its annual QC sample sizes:

- If the average monthly caseload is under 10,000, then the minimum sample size is 300 cases per year.
- If the average monthly caseload is over 60,000, then the standard minimum sample size is 2,400 cases per year and the optional minimum size (defined below) is 1,200 per year.
- If the average monthly caseload is between 10,000 and 60,000, the standard and optional minimum samples are derived by the following formulas:

Standard minimum = 300 + 0.042 (N - 10,000)

Optional minimum = 300 + 0.018 (N - 10,000),

where N is the average monthly caseload

A state may choose the optional minimum sample size if it agrees not to dispute later payment error rate findings and the associated sanctions on the basis of the precision of the estimates.

Federal subsamples are drawn from the set of all state-completed cases for a given fiscal year. The size of the federal subsample varies from 150 to about 800 cases per year, depending on the state sample size.

C. CREATION OF THE QC DATABASE FROM THE IQCS DATA

The QC database is created from the IQCS data through five steps: (1) preliminary processing, (2) data editing, (3) variable construction, (4) weighting, and (5) edits to households with aliens.³

1. Preliminary Processing

The IQCS data is first converted to a SAS file. A series of quality control counts and frequency distributions for the values of each variable on the file are then generated and inspected. Data that are out of range, missing from the file, or coded as unknown on the source file are assigned missing value codes. Records coded as having an incomplete QC review are then removed from the file.⁴

2. Data Editing

Measures of unit size, income, and benefit level are very important to any analysis of food stamp households. There are several ways to obtain these measures from the IQCS. The raw data file contains both a reported certified unit size and an affiliation flag for each person in the household. A unit size can be calculated from each. There is a reported unit gross income level as well as reported income amounts for each person for each type of income. These amounts can be summed

³Section II (Creation of the QC Database) describes the file creation process in more detail.

⁴Records with an incomplete review are defined as REVDISP not equal to 1 (review completed).

to obtain unit-level gross income. Values are also reported for net income and benefits, both of which can also be calculated on the basis of values for gross income, total deductions, and unit size. Data for these measures are inconsistent for a number of records on the IQCS file. For instance, the sum of the income of each person in the unit may not equal reported gross income. Such inconsistencies can be rooted in the initial case record information, the transcription and data entry process, or the extraction of the food stamp information for the selected months. It is important to ensure that the various measures of unit size, income, and benefits are consistent, since inconsistencies can interface with a reliable analysis, particularly in analyses of program changes.

The overall strategy of the IQCS editing process is to ensure that certain basic relationships hold for all cases. The two most basic relationships that should hold for the reported program variables are:

- Net income must equal gross income minus the total deductions for which the unit is eligible.
- The food stamp benefit level must equal the maximum benefit for that unit size minus 30 percent of net income.

In addition, several key relationships must hold for some final and intermediate variables. For example:

- Unit size must equal the number of people coded as affiliated with the food stamp case under review.
- Gross unit income must equal the sum of all person-level income amounts.
- Earned income deduction must equal 20 percent (rounded down) of unit earned income.
- Medical deduction must equal medical expenses over \$35 for units with an elderly or disabled person.
- Excess shelter deduction must equal shelter costs above 50 percent of gross income minus all other deductions up to a cap. Units that contain elderly or disabled members are not subject to the cap.

• Total deductions must equal the sum of the standard deduction and any earned income deduction, medical deduction, excess shelter deduction, dependent care deduction or child support expenditure.

The process by which the editing program determines whether a case is internally consistent and the edits performed if the case is not consistent, is fairly complex and described in detail in Section 2 of this document.

3. Variable Construction

A number of variables are constructed from the reported data once the file is edited. The major classes of constructed variables are unit-level income variables, FSP eligibility and benefit determination variables, characteristics flags, and geographic region variables.

- *Unit-level income variables*. The total FSP unit income variable of a particular type is constructed by summing the person-level income of that type over all persons in the FSP unit and then summing the unit income of each particular type.
- *FSP eligibility and benefit determination variables*. Variables used to determine eligibility and benefits--such as FSP unit deductions, FSP unit net countable income, and FSP unit benefits--are constructed on the basis of unit income and demographic characteristics.
- Characteristics flags. Characteristics flags are created to identify units with certain features, such as the presence of an elderly or disabled person. In addition, data from the Area Resource File (ARF) are merged to identify whether a unit resides in an urban or rural area.

4. Weighting

The original weights on the file are adjusted proportionally so that they replicate, by state, the monthly number of FSP units as reflected in the FSP operations data. Program operations figures are derived from FNS's National Data Bank and reflect actual levels of participation and benefit issuance. Thus, the weighted number of households on the QC database matches program operations figures.

The QC file does not, however, have a person-level weight. Therefore, weighted QC database estimates of the number of FSP participants do not necessarily match program operations totals.⁵

5. Edits to FSP Units with Aliens

Data on aliens reported in the IQCS and subsequently edited in the creation of the QC database is sometimes inconsistent. These inconsistencies make reform simulations involving aliens slow and relatively inaccurate. Because of this, data on aliens are edited during the initial data editing process (that is, in step 2 above). Additionally, the fiscal year 1997 QC file development process expanded these edits to deal with non-alien inconsistencies.

D. FINAL QC DATABASE

After the QC database is created through the preceding five steps, a SAS version and two binary versions of the file are created. The SAS file is used for tabulations of the characteristics of FSP households. One binary file is used to tabulate the characteristics of FSP households with Table Producing Language software, and the other binary file is used as the underlying database for FNS's QC Minimodel microsimulation model.

⁵Sampling error should cause random differences between QC database estimates of the number of FSP participants and the actual number of FSP participants. Nevertheless, the QC database consistently overestimates the number of FSP participants and consistently underestimates total FSP benefits. The discrepancies are small in magnitude and consistent in their direction. A detailed discussion of this anomaly and its possible causes are described in a memorandum to Alana Landey and Jenny Genser of FNS from Mike Stavrianos of MPR ("Investigation of the Differences Between QC Database and Program Operations Counts of FSP Participants and Benefits," 3/5/96).

SECTION 2 CREATION OF THE QC DATABASE

III. FISCAL YEAR 1997 QC FILE DEVELOPMENT PROCESS

The following is a description of the programs and data used in the development of the 1997 QC file.¹ The development process is also illustrated in Figure III-1.

Step 1.

The 1997 FNS data was downloaded from 9 track tape to PC disk:

INPUT TAPE: Tape labeled, 6250 BPI, Character format (EBCDIC)

Record length 1,926; Block size 19,260

55,851 Records

OUTPUT FILE: IQCS1997.DAT (ASCII, 55,844 Records)

Step 2.

Specified fields from the raw FNS file were converted to SAS format, the unique record identifier HHLDNO was created, and stratum codes were corrected to reflect FNS's updated specifications.

PROGRAM NAME: SASIFY97.SAS

INPUT FILE: IQCS1997.DAT (ASCII, 55,844 Records)

OUTPUT FILE: QCFY9701.SD2 (55,844 Records, 438 Variables)

Step 3.

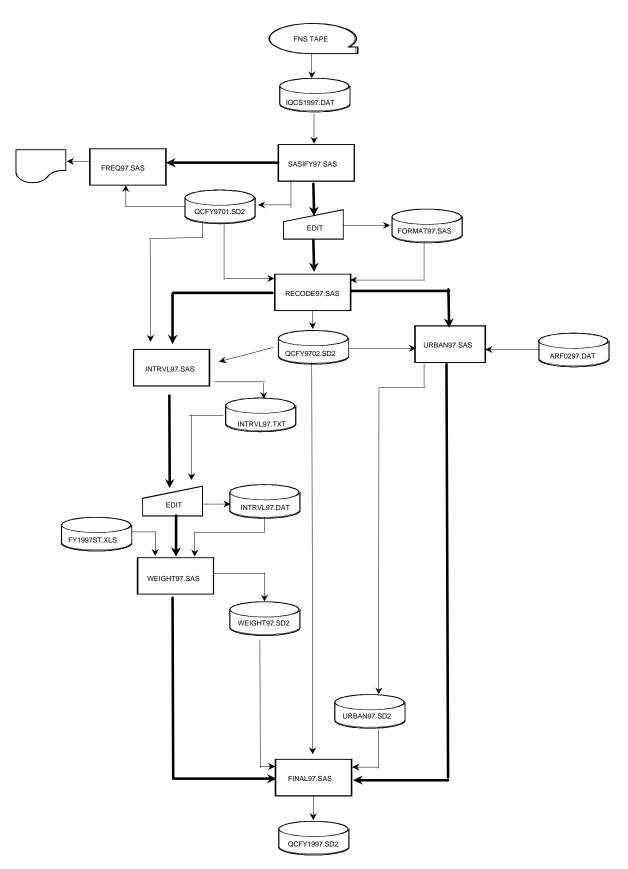

Preliminary frequencies were run on the SAS file. The frequencies were checked for evidence of data corruption, consistency across areas and months, and the extent of missing and out-of-range data.

PROGRAM NAME: FREQ97.SAS

INPUT FILE: QCFY9701.SD2 (55,844 Records, 438 Variables)

¹A copy of the computer programs used in the development of the FY1997 QC database is available upon request from FNS.

FIGURE III.1 FISCAL YEAR 1997 IQCS FILE DEVELOPMENT PROCESS

Step 4.

A hand-entered program parameters format library containing format values for maximum benefit and income screen was constructed. This program was used in Step 5.

OUTPUT PROGRAM: FORMAT97.SAS

Step 5.

An edit program created several unit-level variables pertaining to FSP affiliation, income deductions, shelter limit, benefit amount, assets, poverty status, and specific types of income. Income and asset values that were considered out-of-range were set to missing. Inconsistencies between person-level income totals and reported totals were detected and resolved using a procedure that first selects the most appropriate unit-level income and deduction amounts, then edits the person-level income amounts so that the totals will match the selected amounts. This procedure is described in detail in chapter IV. Units meeting the following conditions were written to the output file: (1) completed review; (2) contain at least one FSP participant under review; and (3) receive a benefit amount of at least one dollar.

PROGRAM NAME: RECODE97.SAS

INPUT FILES: QCFY9701.SD2 (55,844 Records, 438 Variables)

FORMAT97.SAS (Format library)

OUTPUT FILES: QCFY9702.SD2 (48,854 Records, 544 Variables)

Step 6.

A file was created containing State name, FIPS code, and stratum, with one record per State/stratum combination.

PROGRAM NAME: INTRVL97.SAS

INPUT FILES: QCFY9701.SD2 (55,844 Records, 438 Variables)

OUTPUT FILE: INTRVL97.TXT (ASCII, 100 Records)

Step 7.

The INTRVL97.TXT file was edited by hand to add interval information (obtained from FNS) for each State/stratum combination. The edited file was saved as INTRVL97.DAT.

INPUT FILE: INTRVL97.TXT (ASCII, 100 Records)

OUTPUT FILE: INTRVL97.DAT (ASCII, 100 Records)

Step 8.

A weight was calculated for each State/stratum/month combination.

PROGRAM NAME: WEIGHT97.SAS

INPUT FILES: QCFY9701.SD2 (55,844 Records, 438 Variables)

QCFY9702.SD2 (48,854 Records, 544 Variables)

INTRVL97.DAT (ASCII, 100 Records)

FY1997ST.XLS (FNS Excel spreadsheet containing participation

numbers)

OUTPUT FILE: WEIGHT97.SD2 (850 Records, 12 Variables)

Step 9.

Using the local area code, a county FIPS code was assigned to each unit on the edited QC file. Then each unit was merged to the 1997 Area Resource File (ARF) using State and county codes. The PMSA code on the ARF file was used to create an urban/rural status variable.

PROGRAM NAME: URBAN97.SAS

INPUT FILES: QCFY9702.SD2 (48,854 Records, 544 Variables)

ARF0297.DAT (ASCII, 3,082 Records)

ARF0297.DAT is the 1997 Area Resource File.

OUTPUT FILE: URBAN97.SD2 (48,854 Records, 6 Variables)

Step 10.

The files containing weights and urban/rural flags were merged with the edited QC file, to produce the final Fiscal Year 1997 QC file.

PROGRAM NAME: FINAL97.SAS

INPUT FILES: QCFY9702.SD2 (48,854 Records, 544 Variables)

WEIGHT97.SD2 (850 Records, 12 Variables) URBAN97.SD2 (48,854 Records, 6 Variables)

OUTPUT FILE: QCFY1997.SD2 (48,854 Records, 524 Variables)

Step 11.

Using the final QC SAS file, this step creates a hierarchical binary file for the QC Minimodel. Here SAS missing values are coded to negative values. See chapter VI. for more details.

PROGRAM NAME: MINIQC97.SAS

INPUT FILES: QCFY1997.SD2 (48,854 Records, 524 Variables)

OUTPUT FILE: MATHPC.BIN (48,854 Household records, 134,503 Person records)

Step 12.

Using the final QC SAS file, this step creates a hierarchical binary file which is to produce tables with Table Producing Language software. The program also creates a codebook for the Table Producing Language software. SAS missing values are coded to negative values. Additional household level recodes are created for use in table generation.

PROGRAM NAME: QC2TPL97.SAS

INPUT FILES: QCFY1997.SD2 (48,854 Records, 524 Variables)

OUTPUT FILE: QC2TPL97.BIN (48,854 Household records, 134,503 Person records)

QC2TPL97.CBK

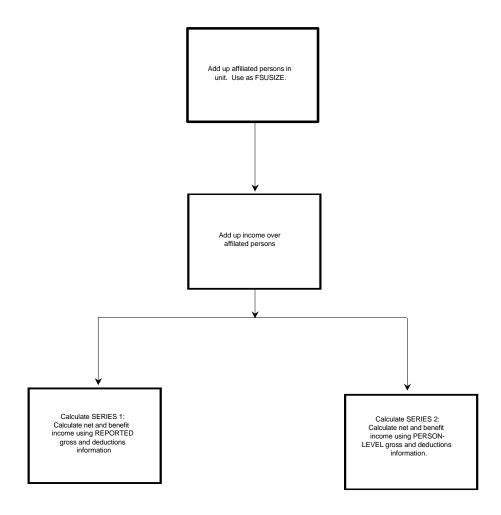

IV. OBTAINING FILE CONSISTENCY

To obtain the highest possible degree of consistency between person-level and unit-level data, while at the same time maintaining the integrity of the database, it is necessary to perform selected editing of the reported data. Since fiscal year 1989, we have implemented a consistent editing scheme as submitted to FNS ("Strategies for Editing the Food Stamp Quality Control Data", April 1989, Patty Anderson). The following is a brief description of the procedures used to obtain file consistency. For more detail, please refer to the RECODExx.SAS program.

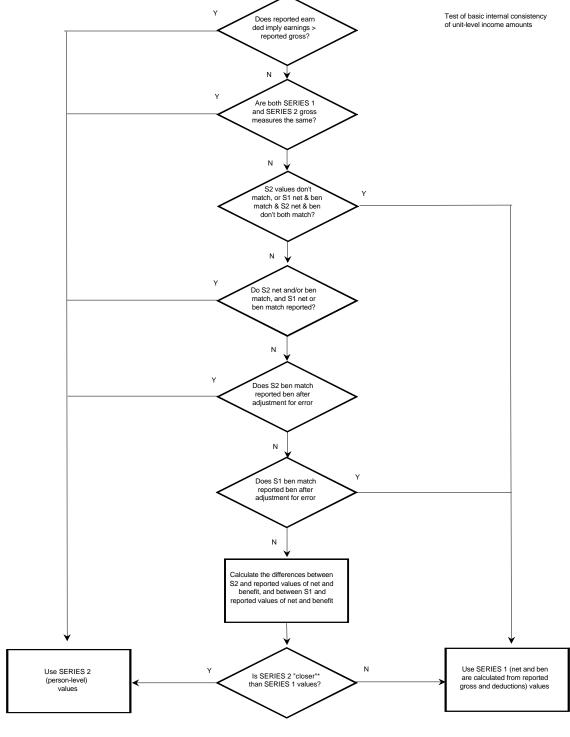

The first task is to reconcile unit size with the number of people receiving food stamps. Checks are then made for out-of-range income values for each affiliated person, and out-of-range asset values for each unit. For person-level income values, any amount that is over 2.5 times the poverty level is set to missing. For unit assets, the upper limit is 2.5 times the asset limit, and any asset value above the upper limit is set to missing. The next task is to reconcile reported person-level income amounts with calculated and reported unit-level income and deduction variables. To reconcile any differences in these measures, the following steps are performed (Figures IV.1 and IV.2):

- (1) We first use the affiliation flags on each person in the unit to construct a measure of unit size as the number of members in the food stamp unit under review. A person is considered to be in the food stamp unit if FSAFILi is between 10 and 20.
- (2) We then construct a measure of unit gross income by adding together all affiliated persons' earned incomes that are not exempt (earned income amounts for students under 18 are excluded) and unearned incomes. Earned income variables are WAGESi, SLFEMPi and OTHERNi. Unearned income variables are SSIi, AFDCi, CONTi, DEEMi, OTHGOVi, EDLOANi, OTHUNi, SOCSECi, GAi, UNEMPi, VETi, WCOMPi and CSUPRTi.
- (3) We construct two different scenarios for the correct FSP benefit. For the first scenario, called Series 1, we use reported unit gross income and the reported earned income deduction, and then calculate net income and benefit values. For Series 2, we use reported person-level gross income, calculate the earned income deduction, and then calculate net income and benefit values. For both scenarios, the standard, medical, and dependent care expenses deductions are identical.

- A: Determine FSP unit size
- B: Sum income across persons
- C: Calculate alternative unit-level (SERIES 1) and person-level (SERIES 2) income and benefit amounts

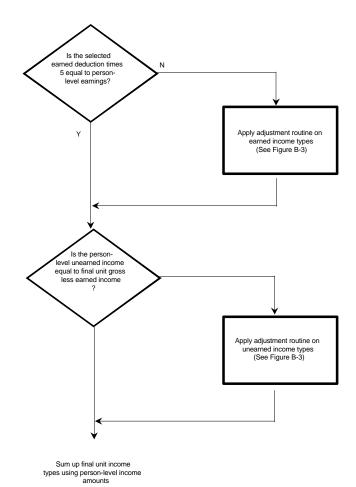

D: Determine which series is most consistent with reported bonus and net income and choose that gross income

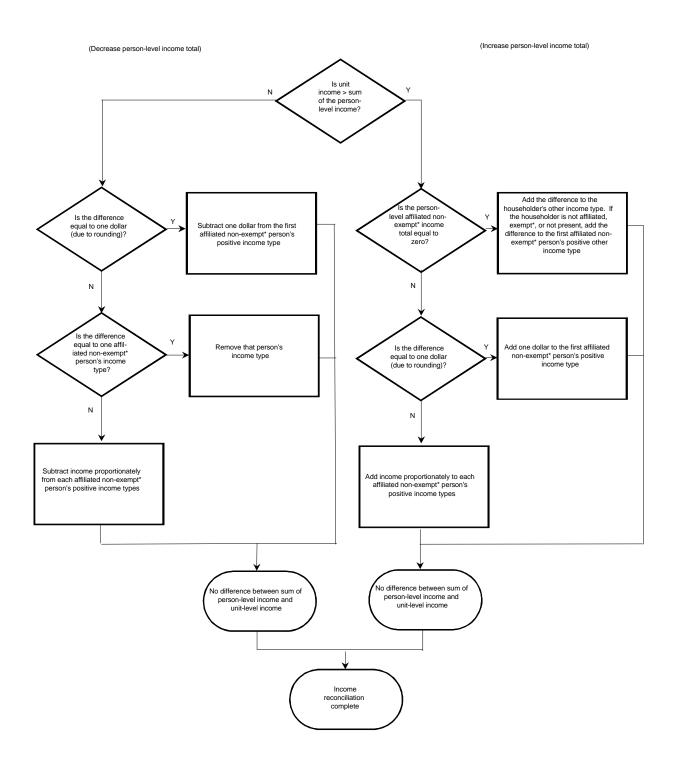

* "Closer" means that: $(S2 \text{ ben - report ben})^{**}2 + (S2 \text{ net - report net})^{**}2 < (S1 \text{ ben - report ben})^{**}2 + (S1 \text{ net - report net})^{**}2$

- E. Reconcile the person-level earnings with the selected earned income deduction (as decided in D)
- F. Reconcile the person-level unearned income with the selected gross income (as decided in D)
- G. Calculate all final values

Adjust person-level earned and/or unearned income amounts to match final unit gross income

^{*} Exempt status is attributed to students under 18 years of age, and is applied to earned income amounts only.

Earned income types for exempt persons are not included as part of unit income.

(4) We then compare each scenario to the reported values of gross income, net income and benefits that are on the data file, to determine which scenario is most consistent with the reported values.

If the reported person-level total gross income (Series 2) is equal to reported unit gross income (Series 1), we use Series 2 values.

If the Series 1 net income and benefit values are both equal to their respective reported values, and either the Series 2 net income or the Series 2 benefit is equal to its respective reported values (but both do not match), we use Series 1 values.

If either the Series 1 net income or the Series 1 benefit is equal to the respective reported value, and neither the Series 2 net income nor the Series 2 benefit matches their respective reported values, we use Series 1 values.

If either the Series 1 net income or the Series 1 benefit is equal to the respective reported value, and both the Series 2 net income and benefit values match the corresponding reported values, we use Series 2 values.

If either the Series 1 net income or the Series 1 benefit is equal to the respective reported value, or if neither the Series 1 net income nor the Series 1 benefit is equal to the respective reported value, and either the Series 2 net income or the Series 2 benefit matches the corresponding reported value, then we use Series 2 values.

If none of the above conditions have been satisfied, we compare the reported benefit amount, adjusted for error, to the Series 1 and Series 2 benefit amounts. If the Series 2 benefit is equal to the reported benefit after adjustment, we use the Series 2 values; otherwise, if the Series 1 benefit is equal to the reported benefit amount after adjustment, we use the Series 1 values. If a series still has not been chosen, we choose the series that minimizes the following error measure: (modeled benefit - reported benefit)² + (modeled net income - reported net income)².

- (5) We reconcile person-level earnings with the chosen earned-income deduction if necessary. If no earnings are reported but the earned income deduction implies positive earnings, we add the difference to the householder's "other earned income"; if the householder is not affiliated, is exempt, or is not present in the unit, we add the difference to the first affiliated non-exempt person's "other earned income". If positive earnings are reported but do not match the earning value implied by the chosen earned income deduction, we proceed with the following adjustments: If the difference is one dollar (due to rounding), we adjust the first affiliated non-exempt person's positive earnings by a dollar. If the difference is greater than a dollar and is equal to one person's positive earnings amount, we remove that person's earnings amount. Otherwise we adjust each positive earnings value by a proportional amount, for each affiliated non-exempt person.
- (6) Person-level unearned income amounts are reconciled with the chosen gross income less earned income measure in the same manner as the person-level earned income amounts.
- (7) Lastly, we sum all person-level income amounts to obtain final unit-level income totals.

V. DERIVATION OF SAMPLING WEIGHTS

The QC file contains two weight variables: (1) the monthly weight (HWGT), and (2) the full-year weight (FYWGT). HWGT is the monthly weight used to replicate the monthly caseload amounts as reflected in Food Stamp Program Operations data. FYWGT is HWGT/12 and can be used to perform full-year tabulations on the QC data.

The tables in Appendix B show the original monthly weights (HWGT) and their derivation for each state and stratum. In states and months without a stratified sample, the weight for each FSP unit (column h) equals the caseload derived from program operations data (columns e and f) divided by the number of cases in the edited sample in that state and month (column g). In states and months with a stratified sample, weights for each stratum are calculated in the same manner as states without a stratified sample. First, though, each stratum's unedited caseload (column c) is adjusted proportionally so that the sum of the new strata's caseloads (column f) equals the state's *reported* caseload (column e). The weight for each FSP unit in each stratum (column h), then, equals the stratum's adjusted caseload (column f) divided by the number of cases in the edited sample in that stratum and month (column g).

The second weight variable, FYWGT, was created in order to do full-year calculations on the data. FYWGT is created by summing up HWGT for the available months and then dividing by the number of months. For fiscal year 1997 12 months worth of data existed for all states. Therefore, FYWGT is simply HWGT/12.

SECTION 3 THE QC-SPECIFIC PORTION OF THE QC MINIMODEL

THE QC-SPECIFIC PORTION OF THE QC MINIMODEL

The QC Minimodel uses a series of algorithms to simulate eligibility, benefits, and participation in the Food Stamp Program. Together, these algorithms comprise the Food Stamp Module (FSTAMP). Some of the algorithms in the FSTAMP module are specific to the input data source (CPS, SIPP, or QC), while others are database independent. This section documents the algorithms that are specific to the QC database. The database-independent algorithms are documented in the MATH SIPP Programmer's Guide, Technical Description and Codebook (Schechter, Sykes, Schmitt, 1997).

In addition, this section provides a technical description of the procedures used to transform data elements from the QC database into the data elements required as input to the database-independent algorithms of FSTAMP.

VI. CREATE MATH-STYLE VERSION OF QC DATABASE

A. INTRODUCTION

1. Documented by: John DiCarlo

2. Coded by: Mark Brinkley

3. Specified by: John DiCarlo

4. Purpose

The QC Minimodel requires a standard binary file in a particular format (MATH style) as input. This section describes the procedure used to create the binary file from the SAS version of the QC database.

B. USER PARAMETERS

None.

C. PROGRAMMER'S GUIDE

1. HIPO Chart

None.

2. Input files

QCFYxx.SD2 Final QC database file, in SAS format.

MATHPC.HDR ASCII header file that describes the record layout of the database file,

MATHPC.BIN

3. Output files

MATHPC.HDR ASCII header file that describes the record layout of the database file,

MATHPC.BIN

MATHPC.BIN QC database file in standard binary form, in a heirarchical format (household

record then person records for persons in the household)

4. Programs

MINIQCxx.SAS

5. Output Variables

The variables are the same as those in the QC data file in SAS format.

D. TECHNICAL DESCRIPTION

The following is a brief description of the procedures used to create a MATH-style version of the QC database. For more detail, please refer to the MINIQCxx.SAS program.

Create a hierarchical file in standard binary format with one household record per record in the SAS dataset. Create one person record for each person in the FSP unit. Convert proprietary SAS missing data codes as follows:

- . -1 (blank on raw QC file)
- .A -2 (coded by MPR as out of range)
- .B -3 (coded by QC reviewer as unknown)
- .C -4 (unable to construct variable)

Edit by hand the MATHPC.HDR file so that its record layout matches the output statement in MINIQCxx.SAS.

VII. QC-SPECIFIC PORTION OF THE QC MINIMODEL

A. INTRODUCTION

1. **Documented by:** Mark Brinkley

2. Coded by: Mark Brinkley

3. Specified by: Mark Brinkley

4. Purpose

The QC Minimodel software is segregated into database-independent (generic) and database-specific components. The generic portions of the QC Minimodel are documented in the MATH-SIPP Programmer's Guide, Technical Description, and Codebook (Schechter, 1997). In this section, we document the QC-specific portion of the model.

B. USER PARAMETERS

None of the user parameters are specific to the QC model. For a list of generic FSTAMP user parameters, see documentation for the database-independent portion of the FSP model (FSTAMP) in the MATH-SIPP Programmer's Guide, Technical Description, and Codebook (Schecther, 1997).

C. PROGRAMMER'S GUIDE

1. Input files

MATHPC.PRM user parameter file (text file)

MATHPC.HDR ASCII header file that describes the record layout of the database file,

MATHPC.BIN

MATHPC.BIN QC database file in standard binary form, in a hierarchical format (household

record then person records for persons in the household)

3. Output files

MATHPC.HDR ASCII header file that describes the record layout of the database file,

MATHPC.BIN

MATHPC.BIN QC database file in standard binary form, in a heirarchical format (household

record then person records for persons in the household)

MATHPC.TAB summary tables

MATHPC.OUT debug file

4. Programs

a. Subroutines

db_fs_counts	increments debug counters and prints totals to
	MATHPC.OUT file
db_fs_hh_definers	creates variables that do not vary by FSU
db_fs_display_partic_debug	dummy routine for comparability with SIPP version
db_fs_unit	identifies which household members belong to which food
	stamp unit and determines whether a person is categorically
	excluded from any FSU
db_fs_locate_vars	locates the database-specific input variables
db_fs_parm_array_sizes	sets the size of database-specific array sizes
db_fs_readparm	reads database-specific user parameters from parameter file
db_fs_validate_parm	validates the user parameters using database-specific criteria
db_fs_participation	determines whether or not eligible units participate
db_fs_display_debug	prints database-specific debug print about the FSP units and
2 0	their eligibility determination
db_fs_vars	creates FSU summary variables (e.g., FSGRINC, FSNET)

b. Modules

fs_dbdefine	common storage for database-specific household definer variables
fs_dblocs	common storage for database-specific variable locations

5. Output Variables

None. All output variables are created by the database-independent portion of the MATH FSTAMP model.

D. TECHNICAL DESCRIPTION

1. Overview

The primary purpose of the QC-specific model algorithms is to use QC-specific data elements to construct the variables needed by the database-independent portion of FSTAMP. The most important QC-specific model algorithms are those in the db_fs_vars subroutine (found in DBVARS.F90). The specifications for these algorithms are found in sections 6 and 7 below.

2. Validate User Parameters

a. Purpose

Although there are no QC-specific user parameters for FSTAMP, some of the generic FSTAMP user parameters must have certain values for the QC model.

b. Specification

The QC model does not support BASELAW = ''. The baselaw simulation is determined by the QC file editing process, *not* by FSTAMP (although the QC file editing algorithms match FSTAMP algorithms exactly). For new baselaws, use BASELAW = FS_VARS in the NTH = 1 parameter set.

FS_VARS = 1 is not allowed, because the variables with a suffix of "1" are always on the file. The original, suffix "1" variables are always needed by the DBVARS routine for imputing medical, shelter, and dependent care expenses, and countable assets (when the unit composition is not that of the original unit). If you change the suffix "1" set of variables on the file, make sure you understand the impact on the DBLOCS, DBDEFINE, and DBVARS calculations.

3. Locate the Input Variables Used and the Output Variables Created

a. Purpose

During KEOF = 1, before processing household records, obtain pointers to variables needed as input to the database-specific model algorithms.

b. Specification

Use the LOCVAR supervisor routine to obtain and store locations for the following variables:

STATE	GA	OTHUN	FSNABAWD	
LOCALCOD	OTHGOV	FSAFIL	FSUN	1
RCNTACTN	SOCSEC	SEX	FSUSIZE	1
FYWGT	UNEMP	REL	FSNKID	1
AGE	VET	DIS	FSNELDER	1
EMPRG	WCOMP	FSMEDEXP	FSNDIS	1
WAGES	EDLOAN	FSDEPEXP	FSASSET	1
SLFEMP	CSUPRT	FSSLTEXP	YRMONTH	
OTHERN	DEEM	SEED	STRATUM	
SSI	CONT	FSNUMPRA	SSIIND	
AFDC				

CASHOT, FSTUD, FSASTEST, FSNETEST, FSGRTEST, and FSPART are all dummy variables for the QC data, but the generic code expects them to be present. If any of these variables is not on the file, *and* they will not be added during NTH=1 (in FSLOCS), then use the supervisor routine ADDVAR to create them, and set the variable USING_ORIGINAL_QCFILE to true. The variable USING_ORIGINAL_QCFILE signals the DBDEFINE routine that this set of variables must be set (either to 0 or 1).

4. Construct Household Definer Variables

a. Purpose

For each household, create household definer variables that are used in subsequent calculations.

b. Specification

Set WGT to FYWGT.

Set U.S., Alaska, Hawaii, Guam & Virgin Islands geographic indicators. GEOG_DED indexes the standard deduction, child care deduction, and shelter deduction arrays; GEOG_SCRN indexes the

gross & net income screen arrays; GEOG_BEN indexes the maximum benefit array; and GEOG_POV indexes the POVMONTH array.

```
select case (state%ihhld)
                                  !! hawaii
  case(15)
   geog\_ded = 3
   geog\_scrn = 3
   geog ben = 5
  case(2)
                                  !! alaska
   geog\_ded = 2
   geog_scrn = 2
    select case(localcod%ihhld)
                                  !! alaska rural i
     case(82)
       geog\_ben = 3
                                  !! alaska rural ii
      case(44,46,47,51)
       geog_ben = 4
      case default
                                  !! alaska urban is default
       geog_ben = 2
   end select
  case(66)
                                  !! guam
   geog\_ded = 4
   geog_scrn= 1
   geog_ben = 6
  case(78)
                                  !! virgin islands
   geog_ded = 5
    geog_scrn= 1
   geog_ben = 7
  case default
   geog\_ded = 1
    geog_scrn = 1
   geog_ben = 1
end select
geog_pov = geog_scrn
region = region_lookup(state%ihhld)
```

Assign FSP reporting status

FS REPORTER - set to true for all households

There are six FSTAMP baselaw output variables that are not on the original QC database. If these six variables are on not present on the input file, then set these variables as follows:

```
DO IP = 1, CTPRHH

L_FTSTUD(1)%IPER(IP) = 0

L_CASHOT(1)%IPER(IP) = 0

IF (L_FSUN (1)%IPER(IP) == IP) THEN

L_FSASTEST (1)%IPER(IP) = 1

L_FSGRTEST (1)%IPER(IP) = 1

L_FSNETEST (1)%IPER(IP) = 1

L_FSPART (1)%IPER(IP) = 1

ELSE

L_FSASTEST (1)%IPER(IP) = 0

L_FSGRTEST (1)%IPER(IP) = 0

L_FSNETEST (1)%IPER(IP) = 0

L_FSNETEST (1)%IPER(IP) = 0

L_FSPART (1)%IPER(IP) = 0

ENDIP
```

Obtain *original* QC values for imputation of shelter, medical, and dependent care expenses (FSSLTEXP, FSMEDEXP, FSDEDEXP) in cases where the FSU is not the original FSU. Note that all of the calculations below *must* be based on the original FSU and its data, even if a new baselaw has

been constructed. Also, set original assets, and total household AFDC (needed for the ALL_PA determination in DBVARS routine).

```
ORIG_FSMEDEXP = ORIGINAL_FSMEDEXP%IHHLD
ORIG_FSSLTEXP = ORIGINAL_FSSLTEXP%IHHLD
ORIG_FSDEPEXP = ORIGINAL_FSDEPEXP%IHHLD
ORIG_FSCSEXP = ORIGINAL_FSCSEXP %IHHLD
ORIG_FSUHEAD = 0
DO IP = 1, CTPRHH
  if (ORIGINAL_FSUN%IPER(IP) == IP) ORIG_FSUHEAD = IP
ORIG_FSUSIZE = ORIGINAL_FSUSIZE %IPER(ORIG_FSUHEAD)
ORIG_FSNKID = ORIGINAL_FSNKID %IPER(ORIG_FSUHEAD)
ORIG_FSNELDER = ORIGINAL_FSNELDER%IPER(ORIG_FSUHEAD)
ORIG_FSNDIS = ORIGINAL_FSNDIS % IPER(ORIG_FSUHEAD)
ORIG_FSASSET = ORIGINAL_FSASSET %IPER(ORIG_FSUHEAD)
ORIG_KIDS_LT15 = 0
HHAFDC = 0
DO IP = 1, CTPRHH
  IF (AFDC%IPER(IP) > 0) HHAFDC = HHAFDC + AFDC%IPER(IP)
  if (ORIGINAL_FSUN%IPER(IP) == 0) CYCLE
  IF ( AGE\%IPER(IP) < 15 &
      .AND. AGE%IPER(IP) >= 0 ) ORIG_KIDS_LT15 = ORIG_KIDS_LT15 + 1
ENDDO
```

5. Construct Food Stamp Unit

a. Purpose

Use the "FSUN 1" code to construct the FSU. Make sure every FSU has a head.

b. Specification

Assign FSUN (food stamp unit number) to each person in the household:

```
DO IP = 1, CTPRHH

FSUN(IP) = ORIGINAL_FSUN%IPER(IP)

CASHOT(IP) = 0

FTSTUD(IP) = 0
```

Identify units that no longer have a head due to a reform - assign them a new head:

```
DO IP = 1,CTPRHH

IF (FSUN(IP) == 0) CYCLE

IF (FSUN(FSUN(IP)) /= FSUN(IP)) THEN

DO JP = IP+1,CTPRHH

IF (FSUN(JP) == FSUN(IP)) FSUN(JP) = IP

ENDDO

FSUN(IP) = IP

ENDDO
```

6. Create FSU Summary Variables

a. Purpose

Characteristics of the each food stamp unit must be summarized by adding the income of all members of the unit and counting various types of people in the unit (such as number of elderly and number children).

b. Specification

Identify students whose earnings are not counted:

For each unit, aggregate the income of people in the FSU:

```
!---- WELFARE SUPPORT (Note: missing income values are coded as < 0)
IF (AFDC%IPER(IP) > 0) FSAFDC(IUNIT) = FSAFDC(IUNIT) + AFDC%IPER(IP)
IF (SSI %IPER(IP) > 0) FSSSI (IUNIT) = FSSSI (IUNIT) + SSI %IPER(IP)
IF (GA %IPER(IP) > 0) FSGA (IUNIT) = FSGA (IUNIT) + GA %IPER(IP)
!---- EARNINGS (NOTE: EXCLUDE STUDENT EARNINGS FROM EARNINGS AND GROSS INCOME)
IF (.NOT. STUDENT(IP)) THEN
  if (wages %iper(ip) >0) fsearn(iunit) = fsearn(iunit) + wages %iper(ip)
  if (OTHERN%: IPER(IP) > 0) FSEARN(IUNIT) = FSEARN(IUNIT) + OTHERN%: IPER(IP)
  IF (SLFEMP%IPER(IP) >0) FSEARN(IUNIT) = FSEARN(IUNIT) + SLFEMP%IPER(IP)
ENDIF
!--- OTHER UNEARNED INCOME
IF (OTHGOV%IPER(IP) > 0) FSGRINC(IUNIT) = FSGRINC(IUNIT) + OTHGOV%IPER(IP)
IF (SOCSEC%IPER(IP) > 0) FSGRINC(IUNIT) = FSGRINC(IUNIT) + SOCSEC%IPER(IP)
IF (UNEMP %IPER(IP) > 0) FSGRINC(IUNIT) = FSGRINC(IUNIT) + UNEMP %IPER(IP)
IF (VET %IPER(IP) > 0) FSGRINC(IUNIT) = FSGRINC(IUNIT) + VET %IPER(IP)
IF (WCOMP %IPER(IP) > 0) FSGRINC(IUNIT) = FSGRINC(IUNIT) + WCOMP %IPER(IP)
IF (EDLOAN%IPER(IP) > 0) FSGRINC(IUNIT) = FSGRINC(IUNIT) + EDLOAN%IPER(IP)
if (CSUPRT%IPER(IP) > 0) FSGRINC(IUNIT) = FSGRINC(IUNIT) + CSUPRT%IPER(IP)
IF (DEEM %IPER(IP) > 0) FSGRINC(IUNIT) = FSGRINC(IUNIT) + DEEM %IPER(IP)
IF (CONT %IPER(IP) > 0) FSGRINC(IUNIT) = FSGRINC(IUNIT) + CONT %IPER(IP)
if (othun %iper(ip) > 0) fsgrinc(iunit) = fsgrinc(iunit) + othun %iper(ip)
```

For each unit, loop over persons in the unit and count the number of unit members with various characteristics:

```
FSUSIZE(IUNIT) = FSUSIZE(IUNIT) + 1

IF (AGE%IPER(IP) > MAX_KID_AGE .OR. AGE%IPER(IP) < 0) THEN
    FSNADULT(IUNIT) = FSNADULT(IUNIT) + 1

ELSE
    FSNKID(IUNIT) = FSNKID(IUNIT) + 1

IF (AGE%IPER(IP) >= MIN_SCHOOL_AGE) FSNK5T17(IUNIT) = FSNK5T17(IUNIT) + 1

IF (AGE%IPER(IP) < 15) KIDS_LT15 = KIDS_LT15 + 1

IF (AGE%IPER(IP) < MAX_TODDLER_AGE) THEN</pre>
```

```
FNDEPLT2(IUNIT) = FNDEPLT2(IUNIT) + 1
ELSE
    FNDEPGE2(IUNIT) = FNDEPGE2(IUNIT) + 1
END IF
END IF

IF ( AGE%IPER(IP) >= MIN_ELDERLY_AGE ) FSNELDER(IUNIT) = FSNELDER(IUNIT) + 1

IF (DIS%IPER(IP) == 1) FSNDIS(IUNIT) = FSNDIS(IUNIT) + 1
```

For each unit, loop over persons in the unit and count persons with public assistance for use in the "pure PA" imputation. Do not consider persons with FSAFIL=11 as on AFDC unless someone in the household (regardless of FSAFIL) has AFDC income.

```
IF ( (
            PUREPA(NTH) >= 1
       .AND. PUREPA(NTH) <= 3
       .AND. FSAFIL%IPER(IP) == 11 &
       .and. hhafdc > 0
                               &
       .or.(
       .AND.( SSI\%IPER(IP) > 0 .OR. GA\%IPER(IP) > 0) &
      THEN
         IF (AGE%IPER(IP) >= 0 .AND. AGE%IPER(IP) <= MAX_KID_AGE) THEN
            KIDSPA = KIDSPA + 1
          ELSE
           ADULTSPA = ADULTSPA + 1
         ENDIF
 ENDIF
```

For each unit, add earnings and welfare income to FSGRINC:

```
FSGRINC(IUNIT) = FSGRINC(IUNIT) + FSEARN(IUNIT) + FSSSI(IUNIT) & + FSAFDC(IUNIT) + FSGA(IUNIT)
```

For each unit, impute "pure PA" status:

```
IF ( (FSNADULT(IUNIT)>0 .AND. ADULTSPA == FSNADULT(IUNIT)) &
    .OR. KIDSPA == FSUSIZE(IUNIT) ) FSALLPA(IUNIT)=1
```

Identify FSUs headed by a single female. This is not used for any eligibility determination. It is used for summary counts only (G/L table). Note that persons with unknown age are NOT considered adults here, nor are they considered children.

```
ADULTS = 0
FEMADULTS= 0
DO IP = 1, CTPRHH
   IF (FSUN(IP) /= IUNIT) CYCLE   ! PERSON NOT IN THE FSU
        IF (AGE%IPER(IP) >= 18 ) THEN   ! NO ONE WITH MISSING AGE SHOULD BE INCLUDED HERE
        ADULTS = ADULTS + 1
        IF (SEX%IPER(IP) == 2) FEMADULTS = FEMADULTS + 1
        ENDIF
ENDDO
IF (ADULTS == 1 .AND. FEMADULTS==1 .AND. FSNKID(IUNIT) > 0) FSNGMOM(IUNIT) = 1
```

7. Impute Medical Expenses, Dependent Care Expenses, Shelter Expenses, and Assets When FSU Is Not the Original FSU

a. Purpose

Asset and expense data recorded on the QC database pertain to the actual food stamp unit (FSU) sampled by the IQCS. However, the QC minimodel has the capability to simulate FSUs with compositions that are different from the composition of the original FSU. A minimodel simulation can form FSUs consisting of any group of persons in a QC household. While the QC system collects income data for each household member, asset and expense data are recorded only for the original FSU as a whole. Thus, the minimodel uses the original FSU's asset and expense data, along with the algorithms described below, to impute the asset and expense data for any simulated FSU that has a composition different from that of the original FSU. The minimodel does not use any of the algorithms described below when the composition of the simulated FSU is the same as the original FSU.

Many different imputation algorithms could be used to impute assets and expenses in simulations that involve changes to FSU composition. The best algorithm to use depends on the type of reform to be simulated. The algorithms described below have been incorporated into the minimodel because they have been used for numerous reform simulations requested by FCS during 1995. These algorithms will work well for many types of reforms, but they are not designed to be generally applicable.

b. Specification

Countable assets. For all simulated FSUs, the minimodel assigns the countable assets of the original FSU:

```
FSASSET (IUNIT) = ORIG_FSASSET
```

This algorithm is intended simply to keep all FSUs asset-eligible in the reform simulation. By keeping all FSUs asset-eligible, the model simulates the effect of a unit composition change solely via the change in income and FSU size that accompany a change in unit composition. This results in a simulation that uses information that is available (income of each unit, and number of persons in each unit), while holding constant the effect of information that is unknown (asset balances of each unit). In reality, changes in countable assets that result from changes in unit composition would cause some FSUs to loose eligibility. Minimodel results will not reflect eligibility losses that occur in this manner.

Shelter expenses. For all simulated FSUs, the minimodel assigns shelter expenses equal to the product of the number of persons in the unit and the per-capita shelter expenses of the original FSU:

```
FSSLTEXP(IUNIT) = NINT( ORIG_FSSLTEXP * FLOAT(FSUSIZE(IUNIT)) / ORIG_FSUSIZE )
```

This algorithm has been incorporated in the minimodel because it was used by FCS for many reform simulations during 1995.

In reality, a household's shelter expenses are assigned to each FSU in the household, based on the share of shelter expenses actually *paid* by each member of each FSU. Although the QC data contain no information regarding which persons are responsible for paying shelter expenses, one could impute payment responsibility based on income; a person with 65 percent of a household's income would be

assumed to be responsible for paying 65 percent of the household's shelter expenses. Again, the best imputation depends on the type of reform to be simulated.

Medical expenses. The minimodel imputes medical expenses based either on the number of elderly persons in the original unit, or, if no elderly are present, on the number of disabled persons. If the original unit contains no elderly persons and no disabled persons, then a medical deduction is not allowed, neither in the original QC file editing process, nor in any minimodel simulations.

```
if (ORIG_FSMEDEXP > 0 ) THEN
if (ORIG_FSNELDER > 0) THEN
  FSMEDEXP(IUNIT) = NINT( ORIG_FSMEDEXP * FSNELDER(IUNIT) / FLOAT( ORIG_FSNELDER))
ELSE if (ORIG_FSNDIS > 0) THEN
  FSMEDEXP(IUNIT) = NINT( ORIG_FSMEDEXP * FSNDIS(IUNIT) / FLOAT( ORIG_FSNDIS ) )
ELSE
  FSMEDEXP(IUNIT) = 0
ENDIF
```

When both an elderly person and a non-elderly disabled person are present, note that the algorithm uses only the number of elderly persons, rather than both the number of elderly and the number of disabled persons. The implicit assumption is that, in any given household, it is likely that medical expenses are being generated by a single person, rather than multiple persons. If the medical expense are likely to be generated by a single person, the elderly person is more likely than the non-elderly disabled person to be generating the expenses; FY 1993 data show that only 2 percent of FSP households with non-elderly SSI recipients received a medical deduction, while 15 percent of elderly households received a medical deduction.

The medical expense imputation algorithm works best when persons are being removed from the original FSU, and when the original FSU is being split into two or more units. When persons not currently participating in the FSP (i.e. persons with FSAFIL 30-39) are being brought into the original FSU, the algorithm produces somewhat artificial results. In these latter cases, in reality, some FSUs without any medical expenses would bring in elderly persons who have medical expenses. Conversely, some FSUs with medical expenses would bring in elderly persons who do not have medical expenses. However, the minimodel algorithm only adds new medical expenses to a unit when medical expense already exist within the original unit. Conversely the minimodel algorithm never adds any new medical expenses to any units that did not already exist within the original unit.

For the FY 1995 QC minimodel, the following distribution shows the percentage of households for which each algorithm would be used if all units were simulated to have a change in composition:

```
No medical expenses reported:

Medical expenses imputed using number of elderly:

Medical expenses imputed using number of disabled:

Medical expenses not used - no elderly, no disabled:

0.15%
```

Dependent care expenses. The minimodel imputes dependent care expenses to simulated FSUs using a hierarchy of alternative algorithms. In most cases, dependent care expenses are assigned based on the number of children under age 15 in the FSU.

```
IF (ORIG_FSDEPEXP > 0) THEN
IF (ORIG_KIDS_LT15 > 0) THEN
```

For the FY 1995 QC minimodel, the following distribution shows the percentage of households for which each algorithm would be used if all units were simulated to have a change in composition:

No dependent care expenses reported:

Dependent care expenses imputed using # of kids under age 15: 3.28%

Dependent care expenses imputed using # of kids age 15-17: 0.01%

Dependent care expenses imputed using # of elderly & disabled: 0.08%

Dependent care expenses imputed to the first FSU in the household: 0.01%

Child support payment expenses. The QC model imputes the child support payment expenses of the original unit to the head of the original unit. The child support deduction is equal to the child support expenses.

```
if (orig_fscsexp > 0 .and. &
    fsun(orig_fsuhead) == iunit) fscspded(iunit) = orig_fscsexp
```

For any reform plan, the child support expenses are assigned to whichever simulated FSP unit contains the head of the original unit. If the head of the original unit does not belong to any of the reform units, then the child support expenses are not used.

8. Select Participants

a. Purpose

After eligibility is determined for an FSU in the household, the model must simulate whether or not the FSU decides to participate. For the QC version of the model, all eligible units are selected to participate. Because every household on the file did in reality participate in the FSP, the all-eligible-units-participate model is reasonable in most cases. If a large reduction in FSP benefits is simulated, the user may want to model some eligible households to decide *not* to participate.

b. Specification

```
DO IUNIT = 1, CTPRHH

FSPART(IUNIT) = 0

IF (FSUN (IUNIT) /= IUNIT) CYCLE ! NOT THE FSU HEAD

IF (FSBEN(IUNIT) > 0) FSPART(IUNIT) = 1 ! ALL ELIGIBLE UNITS PARTICIPATE

END DO
```

SECTION 4

CODEBOOK

VIII. DESCRIPTION OF VARIABLES ON THE QUALITY CONTROL FILE

In this chapter, we describe the variables on the Fiscal Year 1997 QC file. The codebook lists each variable name and provides a description of each variable. Appendix C contains FY 1997 FSP program parameters, Appendix D contains state and region codes, and Appendix E contains the Integrated Review Schedule input form.

A. REPORTED VARIABLES

The "Origin" column in this documentation indicates the source of each particular variable as either reported or constructed. Variables coded "R" are those reported on the Integrated Review Schedule input form (Appendix E) and have been read directly from the IQCS extract, although some editing may have taken place as noted in the variable description.

B. CONSTRUCTED VARIABLES

Variables coded "C" are constructed or recoded variables that are derived from reported variables and program parameters (such as the Thrifty Food Plan and the FSP benefit reduction rate). In some cases, reported variables exist for similar concepts, such as gross and net income. Constructed variables represent the best variables for analytical purposes because inconsistencies have been corrected.

The following variables are used in creating the tables in the "Characteristics of Food Stamp Households: 1997" report series and should be used to obtain consistent results:

Unit food stamp benefit amount -- use FSBEN

Unit size -- use FSUSIZE

Unit total income -- use FSGRINC

Unit net income -- use FSNETINC

Unit earnings deduction -- use FSERNDED

Unit poverty percentage -- use TPOV

C. MISSING VALUES

Missing value codes have been used to indicate various situations as follows:

- . Blank on source file
- .A Value out of range
- .B Coded by QC reviewer as unknown (reviewer coded the field with all 9s)
- .C Pertains to constructed variables only; means that variable could not be constructed or calculated due to missing data

The above codes are stored in the SAS file to represent missing values. Non-SAS files will have the following codes:

- -1 Blank on source file
- -2 Value out of range
- -3 Coded by QC reviewer as unknown (reviewer coded the field with all 9s)
- -4 Pertains to constructed variables only; means that variable could not be constructed or calculated due to missing data

D. USING THE DATA FILE

The Fiscal Year 1997 Food Stamp QC database is a SAS file with 48,854 observations from 12 sample months--October 1996 to September 1997 for all states. The user has the flexibility to choose all 12 months, one month, or a set of months to conduct analyses. To conduct analyses for a specific calendar month, the user should select observations sampled in that month by using the year month (YRMONTH) variable. The year month variable is a four digit code with the first two digits indicating the year and the last two digits indicating the month. For example, if the user desires to conduct

analysis based on observations from January 1997, all observations with a YRMONTH code equal to "9701" should be selected. If the user does not specify a subset of observations based on YRMONTH, all months will be included in the analysis.

After the desired observations are selected, the observations must be weighted so that the sample represents the national food stamp caseload. To weight the sample, the user must assign a weight to each observation. The weights, which are based on actual program participation, are computed for each of the 12 independent monthly samples and are stored in the variable HWGT. (For a description of the sampling weight, see section 2). When analyzing one specific calender month, the user should use the YRMONTH code to select the correct observation and then use HWGT field unaltered. However, if the analysis is based on more than one month, and an average monthly estimate is desired, the user should select the observation and divide the weight by the number of months being analyzed. HWGT should be used for all monthly tabulations and FYWGT for all full-year tabulations.

To use the QC database to obtain information on persons receiving food stamps, rather than unitlevel data, the user must array the FSP affiliation code (FSAFIL1-FSAFIL15). When an array member has a value between 10 and 20, that person participated in the FSP.

The Fiscal Year 1997 Food Stamp QC database is used to produce the report entitled "Characteristics of Food Stamp Households: 1997" (expected release date is spring 1999). The summary tables which appear in the report are based on the full-year sample--October 1996 through September 1997. To produce these characteristics, we selected all observations for all months and weighted the observations by FYWGT to reflect the national monthly average caseload during the Fiscal Year 1997.

IX. CODEBOOK

This codebook lists and describes each variable in the FY 1997 QC file. The unit-level variables are listed first, followed by the person-level variables. The unit-level variables are divided into the following 6 categories:

- (1) Unit QC review administrative data
- (2) Unit demographics and sample weights
- (3) Unit income
- (4) Unit assets
- (5) Unit expenses and deductions
- (6) Unit benefits

The person-level variables are divided into 2 categories:

- (7) Person-level characteristics
- (8) Person-level income

The categories appear in the order shown above. The variables in each category are listed alphabetically. Two codebooks are presented, both sorted in the exact same order. The first codebook--the quick-reference codebook--lists only the variable name, its origin, and a brief description, while the second codebook--the detailed codebook--lists the variable name, its origin, and a detailed description that includes all the valid values of the variable.

VARIABLE	ORIGIN	DESCRIPTION	Quick-Reference Codebook

Unit QC Review Administrative Data

ACTNTYPE	R	Type of action
AUTHREP	R	Authorized representative
CASE	R	Case classification
CERTMTH	R	Months in certification period
EXPEDSER	R	Received expedited service
HHLDNO	C	Household identification number
LASTCERT	C	Months since last certification for food stamps
LOCALCOD	R	Local agency code
PRIOR	R	Received prior assistance
RCNTACTN	R	Most recent action on case
RCNTOPEN	R	Most recent opening/application
REVNUM	R	QC review number
REVTYPE	R	Type of review
SEED	C	Random number between 0 and 1
STATUS	R	Status of case error findings
YRMONTH	R	Sample year and month

Unit Demographics and Sample Weights

CERTHHSZ	R	Certified unit size

Detailed Codebook

Under 1997 FSP regulations, persons of citizenship type 7, 11, 12, and 14 are *always* ineligible for the FSP. Nevertheless, some persons with these citizenship types appear in the FSP unit. Such persons will have a '9' appended to their CTZN code (that is, their codes are 79, 119, 129, or 149).

Persons of citizenship type 4-6, 10, 15-18 are eligible for the FSP and should be either included or excluded from the FSP unit according to standard FSP unit definition regulations. Nevertheless, some persons with these citizenship types appear to be treated as ineligible for the FSP--that is, they are excluded from the FSP *and* deem income back to the FSP unit. Such persons will have a '9' appended to their CTZN code (that is, their codes are 49, 59, 69, 109, 159, 169, 179, 189).

VARIABLE	<u>ORIGIN</u>	DESCRIPTION	Detailed Codebook Person-Level Characteristics

Required to register for work but not participating (15 - 16):

- 15=Required to register for JOBS, but not participating
- 16=Registered for work under the Food Stamp Program, but not participating in an employment and training program

Participating in JOBS or Food Stamp Employment and Training Program (20-29):

- 20=Job search training
- 21=Job search
- 22=Combined job search/work experience program
- 23=CWEP or other work experience program
- 24=Work supplementation, grant diversion or OJT
- 25=Education leading to a high school degree including GED programs and GED preparation
- 26=Post-secondary education leading to a degree or certificate
- 27=Remedial education including adult education programs other than GED preparation
- 28=Vocational training, including JTPA
- 29=Other

Volunteers in an employment and training program (persons exempt because they are caretakers) (30 - 39):

- 30=Job search training
- 31=Job search
- 32=Combined job search/work experience program
- 33=CWEP or other work experience program
- 34=Work supplementation, grant diversion or OJT
- 35=Education leading to a high school degree including GED programs and GED preparation
- 36=Post-secondary education leading to a degree or certificate
- 37=Remedial education including adult education programs other than GED preparation
- 38=Vocational training, including JTPA
- 39=Other

Volunteers in an employment and training program (persons exempt for reasons other than being a caretaker) (40-49):

- 40=Job search training
- 41=Job search
- 42=Combined job search/work experience program
- 43=CWEP or other work experience program
- 44=Work supplementation, grant diversion or OJT
- 45=Education leading to a high school degree including GED programs and GED preparation

¹May have been edited to obtain consistency between final gross income (FSGRINC) and person-level income amounts.

APPENDIX A AUTOMATED EDITS TO FSP UNITS

APPENDIX A

AUTOMATED EDITS TO FSP UNITS

Inconsistencies in the way that alien data are reported in the IQCS and the way that they are subsequently edited in the creation of the QC database makes reform simulations involving aliens difficult and relatively inaccurate. In 1995 we identified and edited inconsistent cases manually to address these problems. However, since manually editing the QC database is both time consuming and prone to error, we developed a set of algorithms to identify and correct these problems automatically during the recode program. This appendix describes what the algorithm looked for and what corrections were made. Additionally, the fiscal year 1997 QC file development process expanded these edits to deal with non-alien inconsistencies.

1. INCONSISTENT CODING OF CITIZENSHIP STATUS CODES

Problem: The citizenship status variable (CTZN) is often coded incorrectly for those people in the FSP unit. Persons with CTZN codes of 7, 11, 12, and 14 are not eligible for the FSP and thus should never be in an FSP unit.

Solution: People in the FSP unit with CTZN codes of 7, 11, 12 or 14 had CTZN changed to 79, 119, 129, or 149 respectively.

2. INCONSISTENT REPORTING OF DEEMED AFDC INCOME

Problem: Some persons outside the FSP unit deem AFDC income to people in the FSP unit but this income is not accounted for correctly within the FSP unit.

Solution: First, we identified households in which, (1) total person level income in the FSP unit is less than the units reported gross income; and (2) the discrepancies between person and unit level income appears to be caused by a person outside the FSP unit

who is deeming AFDC income. Once we identify these cases, the AFDC income of the first person inside the FSP unit without AFDC income is adjusted to reflect the amount deemed from outside the FSP unit. Additionally, those aliens outside the FSP unit who are found to deem AFDC income and who have CTZN codes of 4, 5, 6, 10, 15, 16, 17, or 18 had their CTZN codes changed to 49, 59, 69, 109, 159, 169, 179, or 189, respectively.

3. INCONSISTENT REPORTING OF DEEMED EARNED INCOME

Problem: Some persons outside the FSP unit deem earned income to people in the FSP unit but this income is not accounted for correctly within the FSP unit.

Solution: First, we identified households in which, (1) total person level income in the FSP unit is less than the units reported gross income; and (2) the discrepancies between person and unit level income appears to be caused by a person outside the FSP unit who is deeming earned income. Once we identify these cases, the WAGE income of the first person inside the FSP unit without WAGE income is adjusted to reflect the amount deemed from outside the FSP unit. Those aliens outside the FSP unit who are found to deem WAGE income and who have CTZN codes of 4, 5, 6, 10, 15, 16, 17, or 18 had their CTZN codes changed to 49, 59, 69, 109, 159, 169, 179, or 189, respectively. Additionally, aliens deeming earned income had their earned income adjusted by the ratio of ((# of persons in the FSP unit)+(total # of persons in the household))/(# of persons in the FSP unit).

4. CODING ALGORITHM

The code below is the SAS code used in the recode program to identify and correct the three problems above.

```
*** set up temporary variables ***;

APPENDIX C FY 1997 FSP PARAMETERS

FSP NET INCOME SCREEN, FY 1997

	Income Screen (Dollars Per Month)								
Household Size	Continental U.S., Guam and Virgin Islands	Alaska	Hawaii						
1	\$645	\$805	\$743						
2	864	1,079	994						
3	1,082	1,352	1,245						
4	1,300	1,625	1,495						
5	1,519	1,899	1,746						
6	1,737	2,172	1,997						
7	1,955	2,445	2,248						
8	2,174	2,719	2,499						
Each Additional	+219	+274	+251						

SOURCE: U.S. Department of Agriculture, FNS.

NOTE: The fiscal year 1997 FSP net income limits are based on the 1996 poverty guidelines which were issued by the Department of Health and Human Services and published in the February 1996 Federal Register. FNS derived the fiscal year 1997 net income limits by dividing the 1996 poverty guidelines by 12 and rounding up to the nearest dollar. The 1996 poverty guidelines were developed on the basis of the 1995 Census poverty thresholds. The net income screen is effective from October 1, 1996 to September 30, 1997.

STANDARD DEDUCTION, FY 1997

Area	Standard Deduction
Alaska	\$229
Hawaii	189
Guam	269
Virgin Islands	118
Continental U.S.	134

SOURCE: U.S. Department of Agriculture, FNS.

NOTE: The standard deduction is adjusted each October 1 to reflect changes in the CPI-U for

nonfood items and is effective from October 1, 1996 to September 30, 1997.

SHELTER AND DEPENDENT CARE LIMITS, FY 1997

Area	Shelter Limit (Until 12/31/96)	Shelter Limit (1/1/97 - 9/31/98)	Dependent Care Limit ^{a,b} (per dependent)
Alaska	\$429	434	\$200/175
Hawaii	353	357	200/175
Guam	300	304	200/175
Virgin Islands	182	184	200/175
Continental U.S.	247	250	200/175

^aThe household limit on the dependent-care deduction is equal to the maximum dependent-care deduction multiplied by the number of dependents in the household.

SOURCE: U.S. Department of Agriculture, FNS.

NOTE: The maximum limit for excess shelter expense deductions is adjusted each October

1 to reflect changes in the shelter, fuel and utilities component of the CPI-U and is

effective from October 1, 1996 to September 30, 1997.

^bThe higher dependent-care deduction pertains to dependents under age 2; the lower deduction is for dependents age 2 or more.

MAXIMUM BENEFITS, FY 1997

Household Size	Guam	Alaska Urban	Alaska Rural I	Alaska Rural II	Hawaii	Virgin Islands	Continental U.S.
1	\$177	\$153	\$195	\$237	\$198	\$154	\$120
